1 Continuous Functions

Text excerpts remixed from Vladimir A. Zorich - Mathematical Analysis I as well as Stephen Abbott - Understanding Analysis.

“Let f be a real-valued function defined in a neighborhood of a point $a \in \mathbb{R}$. In intuitive terms, the function f is continuous at a if its value $f(x)$ approaches the value $f(a)$ that it assumes at the point a itself as x gets nearer to a .” (V. A. Zorich)

Definition 1 (Continuous at a point). A function $f : D \subseteq \mathbb{R} \rightarrow \mathbb{R}$ is *continuous at the point* $a \in D$ if

$$\boxed{\forall \epsilon > 0 \quad \exists \delta > 0 \quad \forall x \in D : \quad (|x - a| < \delta \Rightarrow |f(x) - f(a)| < \epsilon)} \quad (1)$$

If f is continuous at every point in the domain D , then we say that f is *continuous on* D .

2 Examples

Here, we give a few examples of continuous functions alongside the respective proofs.

2.1 The constant function is continuous

Theorem 1. *Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be a function given by $f(x) := c$, where $c \in \mathbb{R}$. That is, f is a constant function. Then f is continuous at every point $a \in \mathbb{R}$.*

Proof. Let $a \in \mathbb{R}$ be an arbitrary point where we want to show that $f : \mathbb{R} \rightarrow \mathbb{R}, x \mapsto c$ is continuous. Let $\varepsilon > 0$. We choose $\delta := 1 > 0$. Let $x \in \mathbb{R}$. Then:

$$|f(x) - f(a)| = |c - c| = |0| = 0 < \varepsilon$$

With that, the implication also holds true since its conclusion is always true (as shown above) irregardless of the premise.

$$|x - a| < \delta \Rightarrow |f(x) - f(a)| = 0 < \varepsilon$$

Therefore, f is continuous at a . □

2.2 Functions $x \mapsto mx + y_0$ are continuous

Theorem 2. *Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be a function given by $f(x) := m \cdot x + y_0$, where $m, y_0 \in \mathbb{R}$. Then f is continuous at every point $a \in \mathbb{R}$.*

Proof. Let $a \in \mathbb{R}$ be an arbitrary point where we want to show that $f : \mathbb{R} \rightarrow \mathbb{R}, x \mapsto m \cdot x + y_0$ is continuous.

We first consider the simpler case where the slope is 0, that is $\mathbf{m} = \mathbf{0}$. Then our function is given by $f(x) = y_0$ for all $x \in \mathbb{R}$. This is a constant function and we have already shown that constant functions are continuous. Therefore, f is continuous at a when $m = 0$.

Now to the more interesting case where $\mathbf{m} \neq \mathbf{0}$. Let $\varepsilon > 0$. We choose $\delta := \frac{\varepsilon}{|m|}$. Since $\varepsilon > 0$ and $|m| > 0$, we have $\delta > 0$.

Let $x \in \mathbb{R}$ and $|x - a| < \delta$. Then:

$$\begin{aligned} |f(x) - f(a)| &= |(m \cdot x + y_0) - (m \cdot a + y_0)| \\ &= |m \cdot x - m \cdot a| \\ &= |m \cdot (x - a)| \\ &= |m| \cdot |x - a| \\ &< |m| \cdot \delta = |m| \cdot \frac{\varepsilon}{|m|} = \varepsilon \end{aligned}$$

In the last line, we have used the fact that $|x - a| < \delta$ and then used our definition of δ .

The argument shows that $|f(x) - f(a)| < \varepsilon$, which proves the continuity of f at a . □

2.3 The parabola is continuous

Theorem 3. *Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be defined by $f(x) := x^2$. That is, f is a parabola. Then f is continuous at every point $a \in \mathbb{R}$.*

Proof. Let $a \in \mathbb{R}$ be an arbitrary point where we want to show that $f : \mathbb{R} \rightarrow \mathbb{R}$, $x \mapsto x^2$ is continuous.

Let $\epsilon > 0$. We choose $\delta := \min\left(\frac{\epsilon}{2|a|+1}, 1\right)$. Since $\epsilon > 0$ and $2|a|+1 > 0$ and $1 > 0$, we have $\delta > 0$.

Let $x \in \mathbb{R}$ and $|x - a| < \delta$. Then:

$$\begin{aligned}
 |f(x) - f(a)| &= |x^2 - a^2| = |(x+a)(x-a)| & (2) \\
 &= |x+a| \cdot |x-a| \\
 &\leq (|x| + |a|) \cdot |x-a| & \left. \begin{array}{l} \downarrow |x+a| \leq |x| + |a| \\ \downarrow |x-a| < \delta \end{array} \right\} \\
 &\leq (|x| + |a|) \cdot \delta & \downarrow \\
 &< ((|a| + \delta) + |a|) \cdot \delta & \left. \begin{array}{l} \downarrow |x| < |a| + \delta \text{ (*)} \end{array} \right\} \\
 &= (2|a| + \delta) \cdot \delta \\
 &\leq (2|a| + 1) \cdot \frac{\epsilon}{2|a| + 1} & \left. \begin{array}{l} \downarrow \delta \leq 1 \text{ and } \delta \leq \frac{\epsilon}{2|a| + 1} \end{array} \right\} \\
 &= \epsilon
 \end{aligned}$$

(*) is true because $|x| = |a + (x - a)| \leq |a| + |x - a| < |a| + \delta$. Therefore, $|x| < |a| + \delta$.

The argument shows that $|f(x) - f(a)| < \epsilon$, which proves the continuity of f at a . \square

2.4 The hyperbola is continuous

Theorem 4. Let $f: \mathbb{R} \setminus \{0\} \rightarrow \mathbb{R}$ be defined by $f(x) := \frac{1}{x}$. Then f is continuous at every point $a \in \mathbb{R} \setminus \{0\}$.

Proof. Let $a \in \mathbb{R} \setminus \{0\}$ be an arbitrary point where we want to show that $f: \mathbb{R} \setminus \{0\} \rightarrow \mathbb{R}$, $x \mapsto \frac{1}{x}$ is continuous.

Let $\epsilon > 0$. We choose $\delta := \min\left(\frac{\epsilon|a|^2}{2}, \frac{|a|}{2}\right)$. Since $\epsilon > 0$ and $|a| > 0$, we have $\delta > 0$.

Let $x \in D := \mathbb{R} \setminus \{0\}$ and $|x - a| < \delta$. Then:

$$\begin{aligned}
 |f(x) - f(a)| &= \left| \frac{1}{x} - \frac{1}{a} \right| = \left| \frac{a - x}{ax} \right| & (3) \\
 &= \frac{|a - x|}{|ax|} = \frac{|a - x|}{|a||x|} \\
 &< \frac{\delta}{|a||x|} & \left. \begin{array}{l} |a - x| = |x - a| < \delta \\ |x| > \frac{|a|}{2} \quad (*) \end{array} \right\} \\
 &< \frac{\delta}{|a|\frac{|a|}{2}} \\
 &\leq \frac{\epsilon|a|^2}{2} \frac{1}{|a|\frac{|a|}{2}} \\
 &= \epsilon
 \end{aligned}$$

(*) is true because

$$\begin{aligned}
 |x| &= |a + (x - a)| & \left. \begin{array}{l} \text{Reverse triangle inequality} \\ |x - a| < \delta \end{array} \right\} & (4) \\
 &\geq |a| - |x - a| \\
 &> |a| - \delta \\
 &\geq |a| - \frac{|a|}{2} & \left. \begin{array}{l} \delta \leq \frac{|a|}{2} \end{array} \right\} \\
 &= \frac{|a|}{2} \Rightarrow |x| > \frac{|a|}{2}
 \end{aligned}$$

The reverse triangle inequality used in the first step can also be derived. Let $m, n, u, v \in \mathbb{R}$.

$$\begin{aligned}
 |m + n| &\leq |m| + |n| & (5) \\
 \Rightarrow |m + n| - |n| &\leq |m| \\
 \Rightarrow |u| - |v| &\leq |u + v| & \left. \begin{array}{l} m := u + v, \quad n := -v \end{array} \right\}
 \end{aligned}$$

The argument shows that $|f(x) - f(a)| < \epsilon$, which proves the continuity of f at a .
